

Scientific Collaboration Network Analysis

Authors: Research Systems Team

Overview

This paper gives a basic look at collaboration between researchers and institutions. The aim is to represent research relationships in a way that is easier to understand.

Approach

Researchers were treated as participants in a network, while collaborations between institutions were recorded as connections. The collected information was then grouped to identify active relationships.

Findings

Some institutions may have several research connections while others have fewer. Viewing these connections together can help identify possible areas for future collaboration.

Practical Use

A collaboration dashboard can combine researcher, institution and publication information. This gives administrators a quick overview without requiring them to check every record separately.

Conclusion

Network-based views can provide a simple additional perspective on research activity. The approach can later be expanded with citation and publication information.
